REVIEW Before doing any design, you should ask the questions “What’s my point?” and “Why does it matter?”. These answers, including whether you want to provide exact numbers or patterns and relationships, will guide all your decisions. After identifying the purpose, your presentation medium, and the type of data you have, you’re ready to begin the design process.

Want to provide precise values	↳ Table	Sparsely data	↳ Table
Want to show pattern/relationships of data	↳ Chart	Densely data	↳ Chart

What type of chart would be best for my data?

Most data can be presented in any chart format, but there are best practices about what you should use. The purpose of your presentation and the type of data will at least inform if not determine the type of chart to use. The following is a sampling of best practices that was adapted partly from Kosslyn (1994) and Stephen Few.

- x Use a stacked-bar chart for part-to-whole relationships.
- x Avoid pie charts and rely on bar graphs instead. Pie charts are terrible ways to present data if you want people to understand the patterns they present. “Save the pies for dessert!”
- x Use a line graph if the x-axis will show interval data. Remember, interval data are numerical, have a distinct order, and can be divided into equal portions.
 - o Intervals should always be equal in size (e.g., time, salary distribution, etc). In this case there are data for every other years from start to finish.
 - o Lines should only directly connect values in adjacent intervals. (Leave a gap if have missing data.)
 - o The first of the following charts is a bad example of how to present interval data with missing data; the second is a good improvement. (These were taken from <http://www.perceptualedge.com>)
- x Use a bar graph to show groups comparison. Typically this will be nominal or ordinal data.
- x Use a scatterplot to show correlations.
- x Use stacked bars to present cumulative totals.

(3) Show the data
Don't decorate your data

- **3-dimensional graphs**
- **Pattern or gradient-fills:**
- **Excess decoration**

x **Grid and axes**

x **ticks**

x **Legends and legend borders**
